(54) Title: INSECTICIDAL COMPOSITIONS FOR CONTROL OF GENERAL HOUSEHOLD PESTS

(57) Abstract: The present invention relates to an insecticidal composition comprising a pyrethroid and a second insecticide selected from the group consisting of imidacloprid, nithiazine, thiamethoxam, dinotefuran, nitenpyram, thiacloprid, clothianidin and chlorfenapyr, with significantly improved knockdown and mortality characteristics when applied to general household pests.

WO 2005/070210 A1

**INSECTICIDAL COMPOSITIONS FOR CONTROL OF GENERAL
HOUSEHOLD PESTS**

5 This application claims the benefit of U.S. Provisional Application No. 60/535,667, filed January 9, 2004.

FIELD OF THE INVENTION

10 The present invention relates generally to insecticidal compositions. In particular, it pertains to compositions of insecticides useful for control of general household pests.

BACKGROUND OF THE INVENTION

15 General household pests are insects that have the potential to cause nuisance or harm to person and property, such as the German cockroach, American cockroach, Smokey-Brown cockroach, Oriental cockroach, house fly, biting fly, filth fly, red imported fire ant (RIFA), odorous house ant, carpenter ant, pharaoh ant, Argentine ant, mosquito, tick, flea, sowbug, pillbug, centipede, spider, silverfish, scorpion and bed bug. The following are some examples of nuisance or harm to
20 persons and property. Cockroaches and flies can appear in people's living environment at any place and at any time. They generally contaminate food and articles subjecting people to threats of bacteria and viruses. The continued proliferation of colonies of red imported fire ants, *Solenopsis invicta*, are becoming a serious problem in the United States. Fire ants are attracted to electrical circuits and
25 can cause failures in transformers, cables, connectors and related electrical hardware. Fire ants also can sting persons or animals and generally cause a localized allergic reaction on the area of the skin punctured by their stinging. Some individuals suffer a severe allergic reaction that can lead to anaphylactic shock, which can be fatal if not treated promptly. Many of the general household pests are
30 potentially dangerous since their bites or stings can similarly lead to allergic reaction.

 Insecticidal compositions have commonly been used to control general household pests. Of primary concern in developing an insecticidal composition to control general household pests is the insecticide's 'knockdown' and 'mortality'

characteristics. Knockdown refers to quick, short-term immobilization or death of the pest. Pests can recover from knockdown immobilization. Knockdown usually occurs within 10-30 minutes, but the timing is pest dependant. For example, knockdown for house flies can occur at up to 2 hours because of their tolerance for insecticides and recovery abilities. Mortality refers to death of the pest. An optimal insecticide composition would have knockdown and mortality rates at or near 100% for all general household pests. Current insecticidal compositions, for example, have red imported fire ant and German cockroach mortality rates approaching 100%, but their knockdown rates are only 80% or less for red imported fire ants and 40% or less for German cockroaches. Improved knockdown rates and for many pests improved mortality rates are desirable to ensure effective protection of persons and property from general household pests.

SUMMARY OF THE INVENTION

It has now been unexpectedly found that applications of an insecticidal composition containing a mixture of a pyrethroid and a second insecticide selected from the group consisting of imidacloprid, nithiazine, thiamethoxam, dinotefuran, nitenpyram, thiacloprid, clothianidin and chlorfenapyr, results in a continuous chemical barrier that provides both high knockdown and mortality rates when applied to general household pests. Other aspects of the present invention will also be apparent.

DETAILED DESCRIPTION OF THE INVENTION

It has now been unexpectedly found that an insecticidal composition containing a mixture of a pyrethroid and a second insecticide selected from the group consisting of imidacloprid, nithiazine, thiamethoxam, dinotefuran, nitenpyram, thiacloprid, clothianidin and chlorfenapyr, results in high knockdown and mortality rates when applied to general household pests. Preferred compositions are those wherein the pyrethroid is bifenthrin, cypermethrin, zeta cypermethrin, lambdacyhalothrin, betacyhalothrin, alphacypermethrin, tralomethrin, deltamethrin, cyfluthrin, beta-cyfluthrin, esfenvalerate, fluvalinate, etofenprox, permethrin, metofluthrin, resmethrin, bioresmethrin, allethrin, bioallethrin, s-bioallethrin or

tetramethrin. Further preferred compositions are those wherein the pyrethroid is bifenthrin.

A preferred embodiment of the present invention is a composition wherein the second insecticide is selected from the group consisting of imidacloprid, thiamethoxam and clothianidin. More preferred compositions of the present invention are comprised of from 0.001% by weight to 0.20% by weight of the second insecticide.

Another embodiment of the present invention is a method for controlling general household pests comprising applying an insecticidally effective amount of a composition comprised of a pyrethroid and a second insecticide selected from the group consisting of imidacloprid, nithiazine, thiamethoxam, dinotefuran, nitenpyram, thiacloprid, clothianidin and chlorfenapyr to a locus where general household pest control is needed or expected to be needed. Preferred general household pests are selected from German cockroach, American cockroach, Smokey-Brown cockroach, Oriental cockroach, house fly, biting fly, filth fly, red imported fire ant (RIFA), odorous house ant, carpenter ant, pharaoh ant, Argentine ant, mosquito, tick, flea, sowbug, pillbug, centipede, spider, silverfish, scorpion and bed bug. Preferred locus or loci are selected from a general household pest-infested structure, a structure that is expected to be general household pest-infested, or a location adjacent to the structures.

The amount of each insecticide in the composition can be varied over a wide range depending upon the target pest and the level of control desired. For controlling German cockroaches, preferred liquid insecticide compositions of the present invention are comprised of from 0.001% by weight to 0.005% by weight of bifenthrin and from 0.01% by weight to 0.02% by weight of thiamethoxam; from 0.001% by weight to 0.06% by weight of bifenthrin and from 0.01% by weight to 0.10% by weight of imidicloprid; and from 0.001% by weight to 0.005% by weight of bifenthrin and from 0.01% by weight to 0.02% by weight of clothianidin. For controlling American cockroaches, preferred liquid insecticide compositions of the present invention are comprised of from 0.001% by weight to 0.005% by weight of bifenthrin and from 0.01% by weight to 0.02% by weight of thiamethoxam; from 0.001% by weight to 0.005% by weight of bifenthrin and from 0.01% by weight to

0.02% by weight of imidicloprid; and from 0.001% by weight to 0.005% by weight of bifenthrin and from 0.01% by weight to 0.02% by weight of clothianidin. For controlling Oriental cockroaches, preferred liquid insecticide compositions of the present invention are comprised of from 0.001% by weight to 0.005% by weight of
5 bifenthrin and from 0.0175% by weight to 0.0225% by weight of thiamethoxam; from 0.001% by weight to 0.005% by weight of bifenthrin and from 0.01% by weight to 0.02% by weight of imidicloprid; and from 0.001% by weight to 0.005% by weight of bifenthrin and from 0.01% by weight to 0.02% by weight of clothianidin. For controlling red imported fire ants (RIFA), preferred liquid
10 insecticide compositions of the present invention are comprised of from 0.001% by weight to 0.06% by weight of bifenthrin and from 0.01% by weight to 0.10% by weight of imidicloprid; and from 0.001% by weight to 0.005% by weight of bifenthrin and from 0.01% by weight to 0.02% by weight of clothianidin. For controlling house flies, preferred liquid insecticide compositions of the present
15 invention are comprised of from 0.001% by weight to 0.005% by weight of bifenthrin and from 0.0025% by weight to 0.02% by weight of thiamethoxam; from 0.001% by weight to 0.005% by weight of bifenthrin and from 0.01% by weight to 0.02% by weight of imidicloprid; and from 0.001% by weight to 0.005% by weight of bifenthrin and from 0.01% by weight to 0.02% by weight of clothianidin. For
20 controlling Yellow Fever Mosquitoes, a preferred liquid insecticide composition of the present invention is comprised of 0.001% by weight to 0.005% by weight of bifenthrin and 0.01% by weight to 0.02% by weight of clothianidin.

A liquid insecticide is any formulation containing an insecticide where the formulation is dispensed in an aqueous medium prior to its application to a locus
25 where general household pest control is needed. That is to say, a liquid insecticide is made up of 1) an insecticide, 2) an aqueous medium and 3) other additives conventionally employed in insecticidal formulations (e.g. surfactants, wetting agents, freeze/thaw agents). All formulations of insecticides that are or can be dispensed in an aqueous medium prior to application are, therefore, within the scope
30 of the present invention (e.g. Micro-emulsions, Suspension concentrates, Emulsifiable concentrates, Wettable powders, Water dispersible granules, Capsule suspensions, Emulsifiable granules or combinations thereof).

The compositions of the present invention may be prepared from commercially available formulations of insecticides. For example, bifenthrin, sold by FMC Corporation under the names and trademarks of TALSTAR® GC FLOWABLE INSECTICIDE/MITICIDE, or TALSTARONE® MULTI-
5 INSECTICIDE, to name a few, find utility in the present invention. A formulation of imidicloprid that is particularly useful in the context of the present invention includes, without limitation, imidicloprid (sold under the name and trademark of MERIT), sold as a wettable powder (WP). A formulation of thiamethoxam that is particularly useful in the context of the present invention includes, without
10 limitation, thiamethoxam (sold under the name and trademark of CENTRIC), sold as a 25% water dispersible granular (WDG). A formulation of clothianidin that is particularly useful in the context of the present invention includes, without limitation, clothianidin as a 16% water dispersible granular (WDG). Using methods known to one skilled in the art, the above-mentioned formulations of insecticides
15 can be dispersed in an aqueous medium to provide a composition containing an insecticidally effective amount of an insecticide.

The following examples further illustrate the present invention, but, of course, should not be construed as in any way limiting its scope. The examples set forth certain biological data illustrating the efficacy of the compositions of the
20 present invention in controlling general household pests. Each example embodies a separate test wherein the pests were randomly selected from a population at a random age. As a result, from example to example, the ages of the pests can be very different. This age difference potentially translates to different baselines for each example. Therefore, data should only be compared within the example and not from
25 example to example due to the differences in age of the pests from example to example. Unless otherwise indicated, all parts, percentages, and the like are by weight. The spray chamber used in the examples was approximately 76 inches tall, 73 inches long and 31 inches deep with an adjustable shelf (approximately 22 inches deep) and a movable spray nozzle. The spray chambers were calibrated to deliver a
30 volume of approximately 1 gallon of liquid per 1000 square feet of area at about 14 pounds per square inch of pressure. A DeVilbiss hand held sprayer (Atomizer model 152) manufactured by DeVilbiss located in Glendale Heights, Illinois was

used in testing house flies and mosquitoes. The DeVilbiss was used to apply approximately 3-5 milliliters of product at about 10 pounds per square inch.

EXAMPLE 1

5 Test to Determine German Cockroach Mortality Rates by Applications of Combinations of Bifenthrin and Imidacloprid

The compositions of the present invention were tested for German cockroach activity in the following manner:

10 Test compositions made up of TALSTARONE® MULTI-INSECTICIDE and a wettable powder of imidacloprid (MERIT) in distilled water were prepared that provided appropriate rates of application of combinations of bifenthrin and imidacloprid, as well as bifenthrin and imidacloprid alone.

The spray chamber was then calibrated to deliver the treatment solution at 15 the desired volume and pressure over the desired area on the chamber shelf. Spray chamber shelf height was adjusted to approximately 18 inches from the spray tip. The shelf was then covered with aluminum foil and the center of the shelf from front-to-back and end-to-end was determined. A desired number of 4.0" sieve circles were marked on the aluminum foil with a permanent marker. The inside of a desired 20 number of PVC rings were coated with a petroleum jelly / mineral oil mixture (1:2 ratio). The PVC rings were placed on the sieve circles. 10 male German cockroaches were placed inside each PVC ring. The sprayer was activated and the test compound was applied to each PVC ring interior. German cockroach mortality was measured. The following results were recorded:

25

Test to Determine Red Imported Fire Ant Knockdown and Mortality Rates by Applications of Combinations of Bifenthrin and Imidacloprid

5 The compositions of the present invention were tested for red imported fire ant activity in the following manner:

Test compositions made up of TALSTARONE® MULTI-INSECTICIDE and a wettable powder of imidacloprid (MERIT) in distilled water were prepared that provided appropriate rates of application of combinations of bifenthrin and
10 imidacloprid, as well as bifenthrin and imidacloprid alone.

The spray chamber was then calibrated to deliver the treatment solution at the desired volume and pressure over the desired area on the chamber shelf. Spray chamber shelf height was adjusted to approximately 18 inches from the spray tip. The shelf was then covered with aluminum foil and the center of the shelf from
15 front-to-back and end-to-end was determined. The red imported fire ants to be treated were collected and placed in screened 16 oz paper cups. The paper cups were placed onto the aluminum foil on the spray chamber shelf. The sprayer was activated and the test compound was applied to each paper cup interior. Red imported fire ant knockdown and mortality were measured. The following results
20 were recorded:

B is clothianidin

EXAMPLE 17

Test to Determine House Fly Knockdown and Mortality Rates by Applications of Combinations of Bifenthrin and Clothianidin

The compositions of the present invention were tested for house fly activity
in the following manner:

Test compositions made up of TALSTARONE® MULTI-INSECTICIDE and
a 16% a.i. water dispersible granular of clothianidin in distilled water were prepared
that provided appropriate rates of application of combinations of bifenthrin and
clothianidin, as well as bifenthrin and clothianidin alone.

A DeVilbiss hand held sprayer was used to deliver the treatment solution at
the desired volume and pressure. The house flies to be treated were collected and
placed in screened 16 oz paper cups. The hand held sprayer was activated and the
test compound was applied to each paper cup interior. House fly knockdown and
mortality were measured. The following results were recorded:

EXAMPLE 18

10 Test to Determine Yellow Fever Mosquito Knockdown and Mortality Rates by Applications of Combinations of Bifenthrin and Clothianidin

The compositions of the present invention were tested for Yellow Fever Mosquito activity in the following manner:

15 Test compositions made up of TALSTARONE® MULTI-INSECTICIDE and a 16% a.i. water dispersible granular of clothianidin in distilled water were prepared that provided appropriate rates of application of combinations of bifenthrin and clothianidin, as well as bifenthrin and clothianidin alone.

20 A DeVilbiss hand held sprayer was used to deliver the treatment solution at the desired volume and pressure. The Yellow Fever Mosquitoes to be treated were collected and placed in screened 16 oz paper cups. The hand held sprayer was activated and the test compound was applied to each paper cup interior. Yellow Fever Mosquito knockdown and mortality were measured. The following results were recorded:

5

A is bifenthrin
B is clothianidin

10 In the context of the present invention, the term "insecticide" refers to the active chemical compound or ingredient, such as bifenthrin, cypermethrin, zeta cypermethrin, lambdacyhalothrin, betacyhalothrin, alphacypermethrin, tralomethrin, deltamethrin, cyfluthrin, beta-cyfluthrin, esfenvalerate, fluvalinate, etofenprox, permethrin, metofluthrin, resmethrin, bioresmethrin, allethrin, bioallethrin, s-

15 bioallethrin, tetramethrin, imidacloprid, nithiazine, thiamethoxam, dinotefuran, nitenpyram, thiacloprid, clothianidin, or chlorfenapyr, that kills or causes knockdown of insects. The term "bifenthrin" means 2-methylbiphenyl-3-ylmethyl (Z)-(1RS)-cis-3-(2-chloro-3,3,3-trifluoroprop-1-enyl)-2,2-

20 dimethylcyclopropanecarboxylate or 2-methylbiphenyl-3-ylmethyl (Z)-(1RS, 3RS)-3-(2-chloro-3,3,3-trifluoroprop-1-enyl)-2,2-dimethylcyclopropanecarboxylate, CAS Registry Number 82657-04-3. The term "imidacloprid" means (EZ)-1-(6-chloro-3-pyridylmethyl)-N-nitroimidazolidin-2-ylideneamine, CAS Registry Number 138261-41-3. The term "thiamethoxam" means (EZ)-3-(2-chloro-1,3-thiazol-5-ylmethyl)-5-methyl-1,3,5-oxadiazinan-4-ylidene(nitro)amine, CAS Registry

25 Number 153719-23-4. The term "clothianidin" means (E)-1-(2-chloro-1,3-thiazol-5-ylmethyl)-3-methyl-2-nitroguanidine, CAS Registry Number 210880-92-5 (formerly

205510-53-8). The term "liquid insecticide" refers to a formulation of an insecticide where the formulation can be dispensed in an aqueous medium prior to its application to a locus where insect control is desired. The term "locus" refers to any location where control of insects is needed or expected to be needed. The term

5 "general household pest" refers to any insect or pest, such as German cockroach, American cockroach, Smokey-Brown cockroach, Oriental cockroach, house fly, biting fly, filth fly, red imported fire ant (RIFA), odorous house ant, carpenter ant, pharaoh ant, Argentine ant, mosquito, tick, flea, sowbug, pillbug, centipede, spider, silverfish, scorpion and bed bug, that cause harm or nuisance to person or property.

10 The term "knockdown" refers to the quick, short-term immobilization or death of the insects. The term "mortality" refers to the death of the insects. The term "% by weight" refers to the weight of the insecticide or specified component as a percent of the total weight of the composition (e.g. including the aqueous medium, other insecticides, surfactants, wetting agents, freeze/thaw agents and combinations

15 thereof).

Those of ordinary skill in the art will appreciate that variations of the invention may be used and that it is intended that the invention may be practiced otherwise than as specifically described herein. Accordingly, this invention includes all modifications encompassed within the spirit and scope of the invention as

20 defined by the following claims.

What is claimed is:

Claim 1. An insecticidal composition comprising a mixture of

- i) a pyrethroid and
- ii) a second insecticide selected from the group consisting of imidacloprid, nithiazine, thiamethoxam, dinotefuran, nitenpyram, thiacloprid, clothianidin and chlorfenapyr.

Claim 2. A composition according to claim 1, wherein said pyrethroid is selected from the group consisting of bifenthrin, cypermethrin, zeta cypermethrin, lambdacyhalothrin, betacyhalothrin, alphacypermethrin, tralomethrin, deltamethrin, cyfluthrin, beta-cyfluthrin, esfenvalerate, fluvalinate, etofenprox, permethrin, metofluthrin, resmethrin, bioresmethrin, allethrin, bioallethrin, s-bioallethrin and tetramethrin.

Claim 3. A composition according to claim 2, wherein said pyrethroid is bifenthrin.

Claim 4. A composition according to claim 1, wherein said second insecticide is selected from the group consisting of imidacloprid, thiamethoxam and clothianidin.

Claim 5. A composition according to claim 4, wherein the amount of the second insecticide is equal to from 0.001% by weight to 0.20% by weight.

Claim 6. A method for controlling general household pests comprising applying an insecticidally effective amount of a composition of claim 1 to a locus where general household pest control is needed or expected to be needed.

Claim 7. A method for controlling general household pests comprising applying an insecticidally effective amount of a composition of claim 2 to a locus where general household pest control is needed or expected to be needed.

Claim 8. A method for controlling general household pests comprising applying an insecticidally effective amount of a composition of claim 3 to a locus where general household pest control is needed or expected to be needed.

Claim 9. A method for controlling general household pests comprising applying an insecticidally effective amount of a composition of claim 4 to a locus where general household pest control is needed or expected to be needed.

Claim 10. A method for controlling general household pests comprising applying an insecticidally effective amount of a composition of claim 5 to a locus where general household pest control is needed or expected to be needed.

Claim 11. The method according to claim 6, wherein said general household pest is selected from German cockroach, American cockroach, Smokey-Brown cockroach, Oriental cockroach, house fly, biting fly, filth fly, red imported fire ant (RIFA), odorous house ant, carpenter ant, pharaoh ant, Argentine ant, mosquito, tick, flea, sowbug, pillbug, centipede, spider, silverfish, scorpion and bed bug.

Claim 12. The method according to claim 7, wherein said general household pest is selected from German cockroach, American cockroach, Smokey-Brown cockroach, Oriental cockroach, house fly, biting fly, filth fly, red imported fire ant (RIFA), odorous house ant, carpenter ant, pharaoh ant, Argentine ant, mosquito, tick, flea, sowbug, pillbug, centipede, spider, silverfish, scorpion and bed bug.

Claim 13. The method according to claim 8, wherein said general household pest is selected from German cockroach, American cockroach, Smokey-Brown cockroach, Oriental cockroach, house fly, biting fly, filth fly, red imported fire ant

(RIFA), odorous house ant, carpenter ant, pharaoh ant, Argentine ant, mosquito, tick, flea, sowbug, pillbug, centipede, spider, silverfish, scorpion and bed bug.

Claim 14. The method according to claim 9, wherein said general household pest is selected from German cockroach, American cockroach, Smokey-Brown cockroach, Oriental cockroach, house fly, biting fly, filth fly, red imported fire ant (RIFA), odorous house ant, carpenter ant, pharaoh ant, Argentine ant, mosquito, tick, flea, sowbug, pillbug, centipede, spider, silverfish, scorpion and bed bug.

Claim 15. The method according to claim 10, wherein said general household pest is selected from German cockroach, American cockroach, Smokey-Brown cockroach, Oriental cockroach, house fly, biting fly, filth fly, red imported fire ant (RIFA), odorous house ant, carpenter ant, pharaoh ant, Argentine ant, mosquito, tick, flea, sowbug, pillbug, centipede, spider, silverfish, scorpion and bed bug.

Claim 16. The method according to claim 6, wherein said locus is selected from a general household pest-infested structure, a structure that is expected to be general household pest-infested, or a location adjacent to said structures.

Claim 17. The method according to claim 7, wherein said locus is selected from a general household pest-infested structure, a structure that is expected to be general household pest-infested, or a location adjacent to said structures.

Claim 18. The method according to claim 8, wherein said locus is selected from a general household pest-infested structure, a structure that is expected to be general household pest-infested, or a location adjacent to said structures.

Claim 19. The method according to claim 9, wherein said locus is selected from a general household pest-infested structure, a structure that is expected to be general household pest-infested, or a location adjacent to said structures.

Claim 20. The method according to claim 10, wherein said locus is selected from a general household pest-infested structure, a structure that is expected to be general household pest-infested, or a location adjacent to said structures.

INTERNATIONAL SEARCH REPORT

International application No.
